RESEARCH INTERESTS

My research develops agentic AI systems and large language models for simulation and decision making in public health, health economics, and social systems. I build multi-agent workflows that integrate LLMs, retrieval-augmented generation, and machine learning to model individual behavior, collective choice, and information diffusion in networks, supporting scalable and theory-informed analysis of economic preferences, policy response, and behavioral change. I also study responsible AI for mental health services and methods to improve the reliability, interpretability, and cultural sensitivity of AI-assisted healthcare decision making.
